Dear Gerald,

In re to your letter of Nov. 10, I have tried to telephone you without success. My ancient notes (dated MAy 1946) say that In(2L) al^{130} has breaks after 21C1-2 and before 21E1-2, and that it came from x-raying a ds S^{x} astx chromosome. I subsequently removed the S ast mutants by crossing over, but ds remains in it. Unfortunately, it did not get listed in the red book or the revision. I may have another break in the 21C1-2 region (inversion into 2R) that is awaiting detailed analysis and building of a stock. If you are interested you might keep in touch.

I am sending a copy of this letter to Kathy Matthews, so that she will have the information on hand.

Sincerely,

E. B. Lewis
