Enclosed, find the reprint of our paper, describing the *Drosophila CalpA* gene. The same gene was independently discovered by Emori and Saigo (J. Biol. Chem. 269:25137-25142, 1994). Unfortunately, the chromosomal position of the gene described in their paper is in conflict with our data. We are currently re-examining this question, and although we feel confident in the position we published, it should be considered tentative until the matter has been resolved.

Dan Hultmark

Cytological location in J.B.C. 269:25137 is 50DE

Genbank sequences for this gene = X78555

Name used in JBC paper = dmcalpain
