Re: Deficiency stocks

Hi Kevin,

Here are the stocks I promised.

1) Df(2R)Egfr5 (FlyBase ID FBab0001960) breakpoints 57D2-8; 58D1.

2) Df(2R)2-65. breakpoints: ~57C2; 58B2, induced by chemical mutagenesis with triethylene melamine (TEM: crosslinking agent) in a screen for abberations that result in loss of EGFR activity. (it fails to complement alleles of EGFR)

Both abberations were induced on a b pr cn sca chromosome and are maintained over CyO

Don't forget to check for mites.

Best wishes,

Jim Price
